

**JENKINS IS BROKEN.
WHERE DO I START?**

WHERE TO LOOK

Ingress - Service

ACCESS

How users and agents reach Jenkins

```
kubectl get  
ingress,svc,endpoints
```

StatefulSet pod - init containers

CONTROLLER

UI, jobs, queue, plugins

```
kubectl describe pod <pod>  
kubectl logs <pod> -c <container>
```

PersistentVolume

JENKINS_HOME

Config, builds, logs, artifacts

```
kubectl get pvc
```

Ephemeral pods

AGENTS

Where builds run

```
kubectl describe pod <agent>
```

CLUSTER

Nodes, scheduler, storage, network: what everything runs on

```
kubectl get events -A  
kubectl top nodes
```

NO LEFT SPACE

FULL BEFORE THE BUILD

BUILD NOW DOES NOTHING

NO BUILD, NO CONSOLE, NO POD

Jenkins cannot create the build directory, so the build never exists. The pod stays Running.

Only evidence: the controller log

```
java.io.IOException: No space left on device
```

FILLS UP OVER TIME

BUILDS THAT NEVER CLEAN UP

NOTHING IS EVER DELETED

Old builds: every run keeps its log and history forever.

Branches and PRs: each one becomes a job with its own history.

Artifacts: packages archived on every build.

FIND IT, FIX IT, PREVENT IT

1 · FIND

LOOK INSIDE THE VOLUME

```
df -h /var/jenkins_home
```

```
du -xsh /var/jenkins_home/* |  
sort -h
```

2 · FIX

FREE SPACE OR GROW

```
rm  
/var/jenkins_home/troubleshooting-  
fill
```

Or expand the disk

3 · PREVENT

FIX THE CAUSE

Keep the last N builds per job (build discarder)

Store artifacts in S3, not on the controller

Alert before the volume is full

THANK YOU.
